

## Recommended Problems

### Recommended Problems - Rational normal form

#### Problem 1 (DF, Problem 4, pg. 488)

Prove that two  $3 \times 3$  polynomials are similar if and only if they have the same characteristic and minimal polynomials. Give an explicit counterexample to this for  $4 \times 4$  matrices.

#### Problem 2 (DF, Problem 12,m pg. 489)

Find all similarity classes of  $3 \times 3$  matrices over  $\mathbb{Z}/2\mathbb{Z}$  satisfying  $A^6 = 1$ . Do the same for  $4 \times 4$  matrices satisfying  $B^{20} = 1$ .

#### Problem 3 (DF, Problem 17, p. 489)

Let  $G = \text{GL}_3(\mathbf{F}_2)$ . This group has order  $(7)(6)(4) = 168$ . Find representatives for each of its conjugacy classes.

#### Problem 4 (DF Problems 22-25, pg 490)

These problems show that if  $A$  is an  $n \times n$  matrix over  $F$ , then the matrix  $xI - A$  is the “relation matrix” for the  $F[x]$ -module obtained from  $F^n$  with  $x$  acting as  $A$ . Consequently, to compute the rational normal form for  $A$ , one must use the “smith normal form” algorithm over  $F[x]$  on this matrix to find the invariant factors. (Note: Actually the problem uses  $xI - A^\top$  but this is just a question of conventions regarding rows vs. columns and doesn’t really matter).

### Recommended Problems - Jordan normal form

#### Computations

DF Problems 4-16 on pages 499-501 give a whole bunch of numerical examples; try some.

#### Problem 5 (DF, Problem 22, page 501)

Prove that an  $n \times n$  matrix  $A$  over  $\mathbf{C}$  satisfying  $A^3 = A$  is diagonalizable. Is this true for any field  $F$ ?

**Problem 6 (DF, Problem 31, pag 502)**

A matrix is nilpotent if  $A^n = 0$  for some  $n$ . Prove that a nilpotent matrix is similar to a block diagonal matrix where each block has ones on the superdiagonal and zeros elsewhere.

**Optional:** Problems 40ff in Chapter 12.3 explore applications of the Jordan form to differential equations.
